

# Coordinated Control of Energy Storage in Networked Microgrids

FREEDM Annual Research Symposium 2026

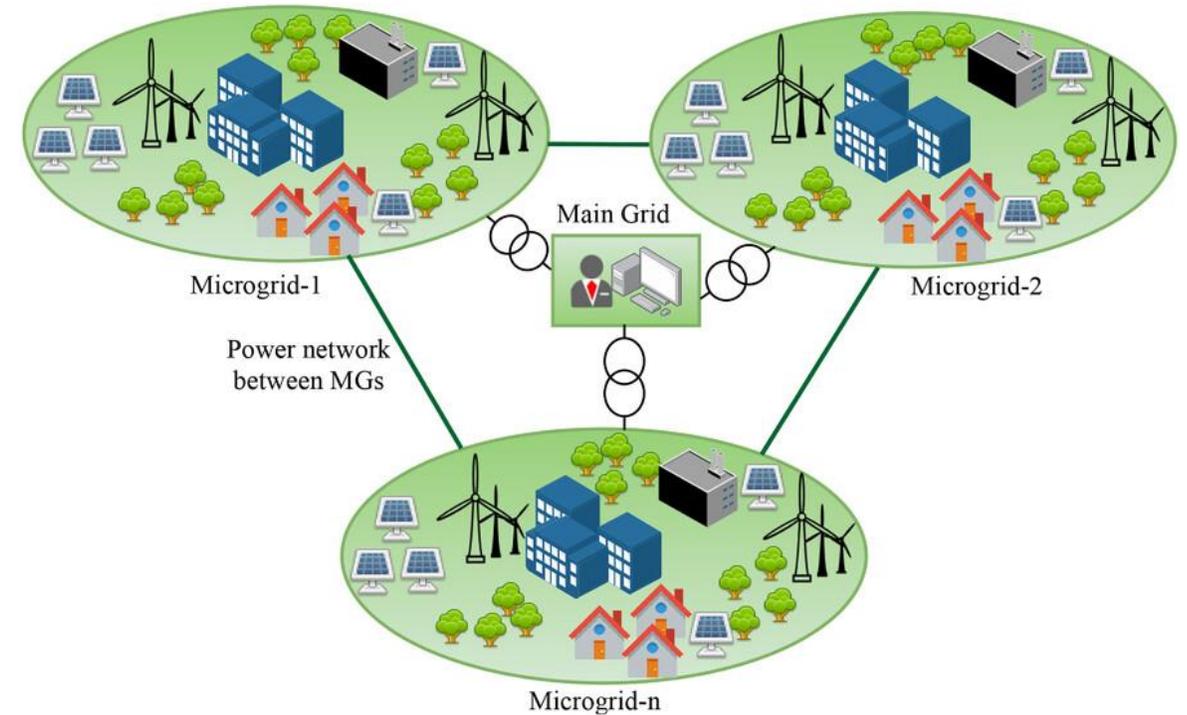

**PI: Aranya Chakraborty, ECE**

**Co-PI: Anderson de Queiroz, CCE**

FREEDM Systems Center, North Carolina State University

# Project Goals

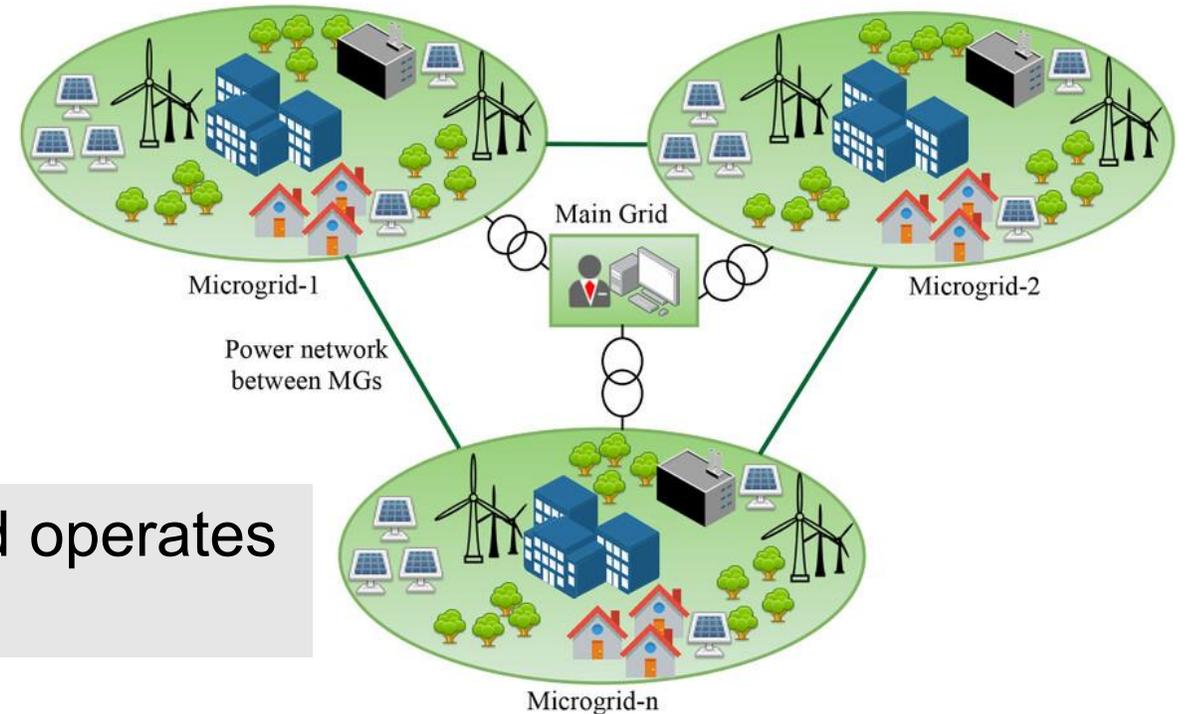

How can grid-tied microgrids *share* each other's energy storage resources via *real-time control and optimization* for coordinated operation during large disturbance events?

# Project Goals

How can grid-tied microgrids *share* each other's energy storage resources via *real-time control and optimization* for coordinated operation during large disturbance events?

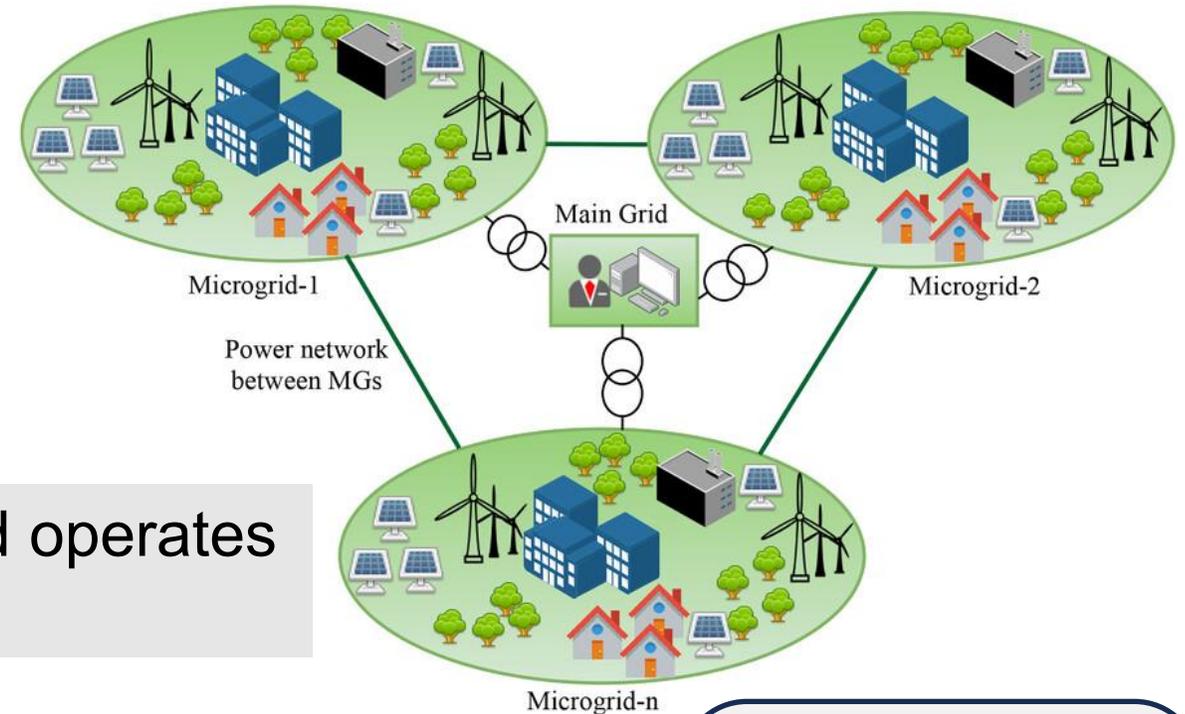

Current state-of-the-art: Every microgrid operates using only *local, myopic controls*

# Project Goals

How can grid-tied microgrids *share* each other's energy storage resources via *real-time control and optimization* for coordinated operation during large disturbance events?

Current state-of-the-art: Every microgrid operates using only *local, myopic controls*

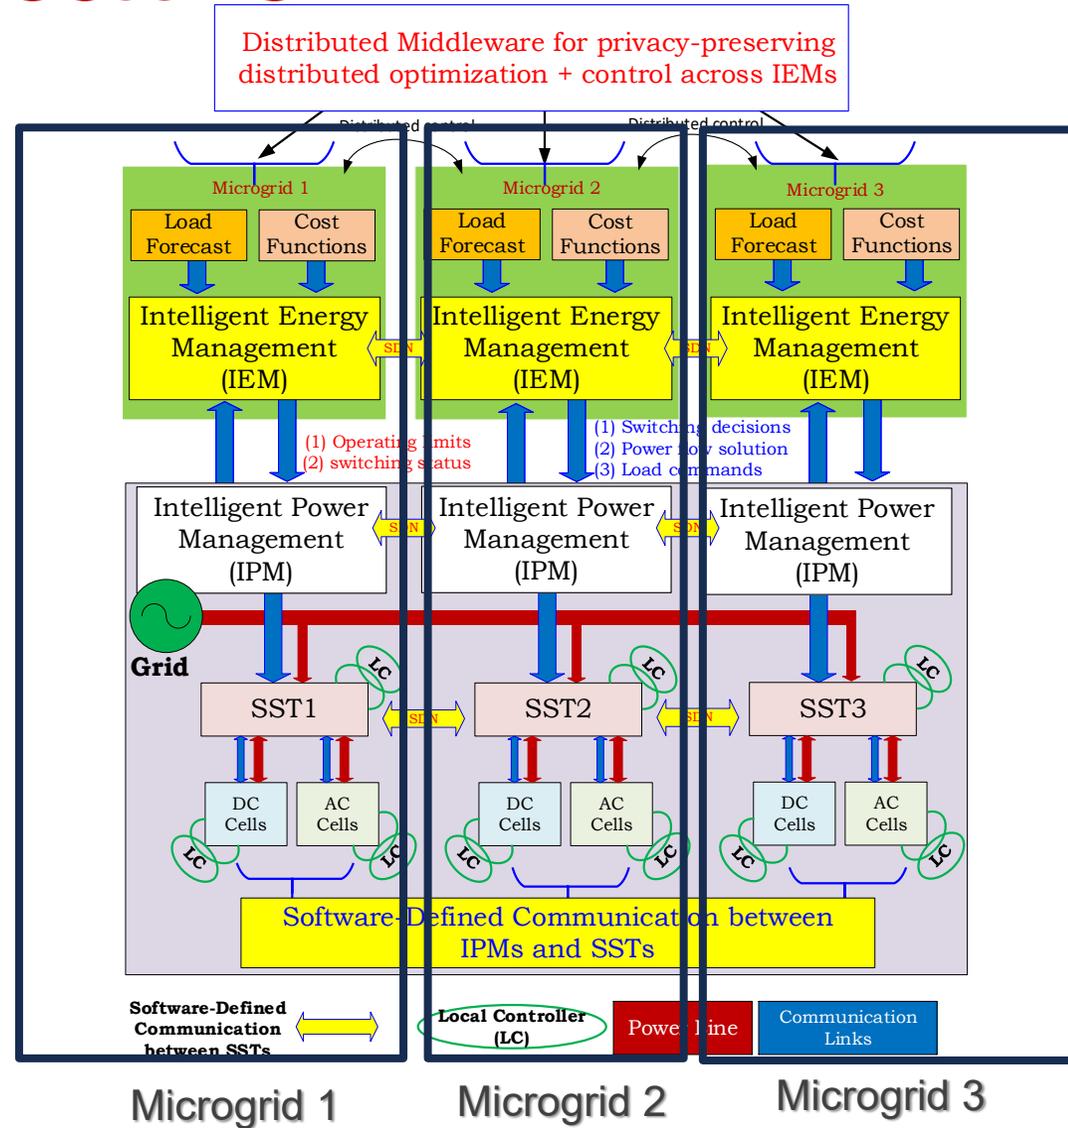

Coordinated control can:

- (1) save operational costs by using shared storage
- (2) batteries act as shock absorbers saving neighboring microgrids
- (3) better stability margins
- (4) better resilience

- (1) Stabilize power compensation,
- (2) Control ramp rates
- (3) Mitigate large step changes

# System Architecture

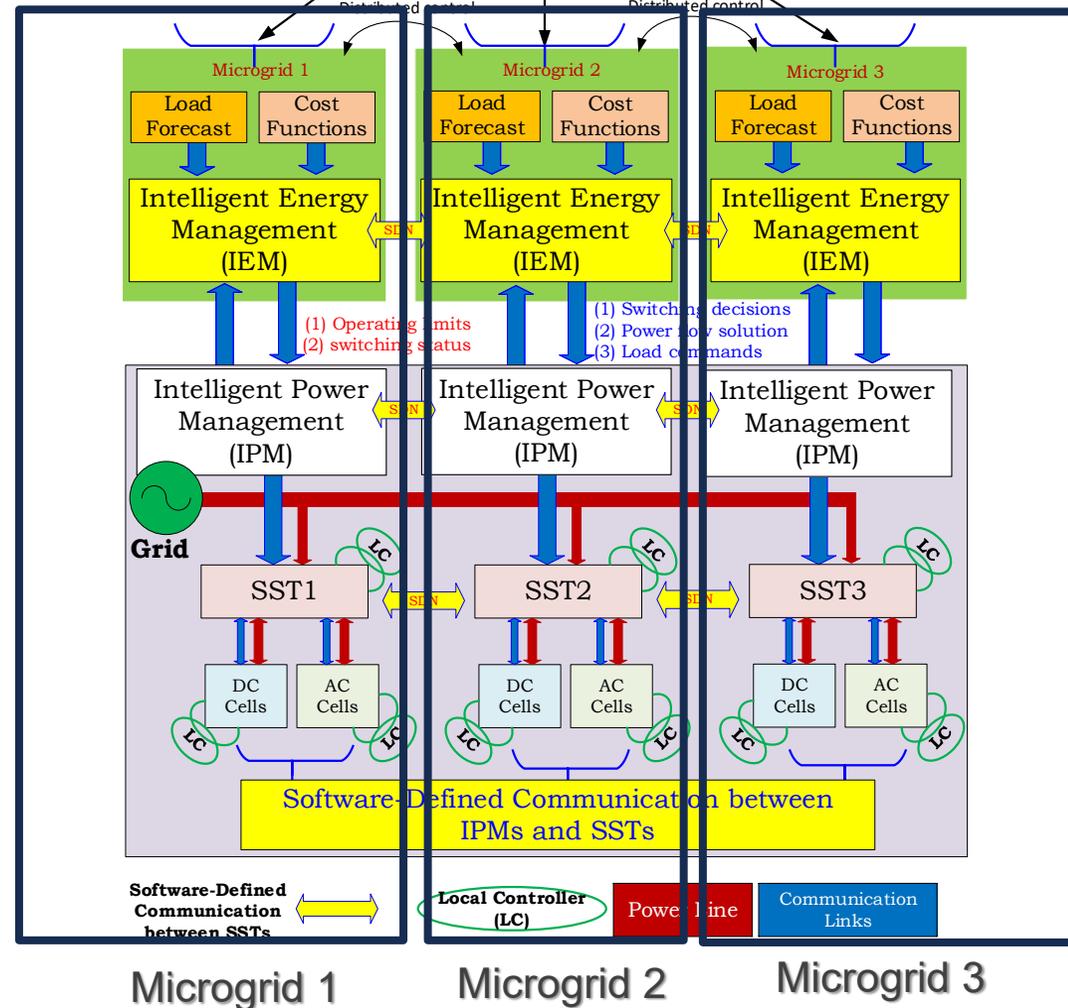

*Field data from M.C. Dean, NREL databases, EIA grid monitor*

# System Architecture

Distributed Middleware for privacy-preserving distributed optimization + control across IEMs

Intelligent Energy Management (IEM)

Optimization  
(Dispatch, OPF, Load Forecasting)

# System Architecture

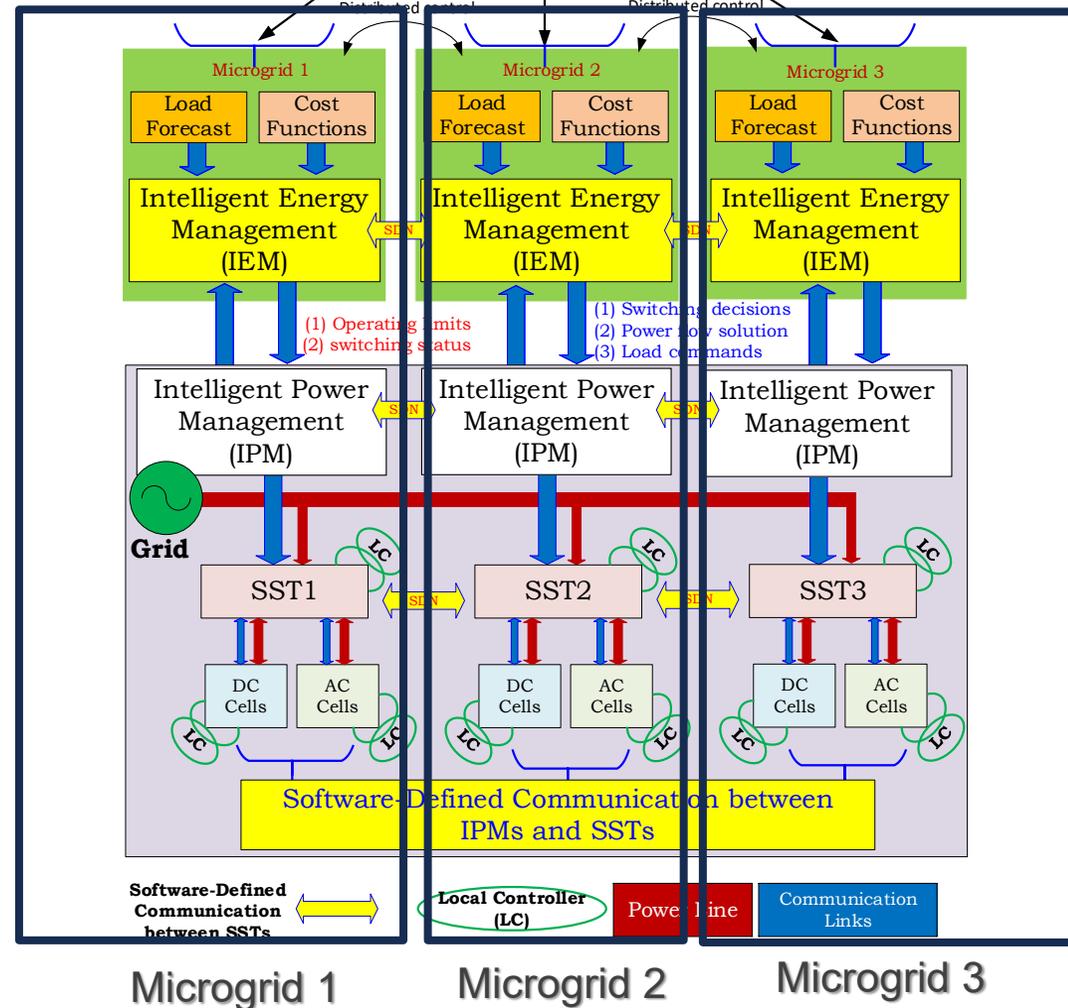

Distributed Middleware for privacy-preserving distributed optimization + control across IEMs

Intelligent Energy Management (IEM)

Intelligent Power Management (IPM)

Optimization  
(Dispatch, OPF, Load Forecasting)

Distributed Control  
(Power flow damping, DC-link voltage regulation, Voltage Stability)

# Two Primary Challenges to Overcome

1. Lack of Exact Model Information:
  - Use Machine Learning Methods for both IEM and IPM
  - IEM: SDDP, MCMC, DL
  - IPM: Reinforcement Learning

# Two Primary Challenges to Overcome

1. Lack of Exact Model Information:
  - Use Machine Learning Methods for both IEM and IPM
  - IEM: SDDP, MCMC, DL
  - IPM: Reinforcement Learning
2. Battery SST models make the grid dynamics nonlinear
  - Linear feedback control may no longer work
  - Nonlinear distributed control is a hard problem
  - IPM: Lifting-based control

# Two Primary Challenges to Overcome

## 1. Lack of Exact Model Information:

- Use Machine Learning Methods for both IEM and IPM
- IEM: SDDP, MCMC, DL
- IPM: Reinforcement Learning

We are doing  
“global”  
IEM/IPM,  
not local

Rely as little on  
the complex  
system model as  
we can

Nonlinear SST  
dynamics from  
BESS and Data  
Center loads

## 2. Battery SST modeling the grid

- Linear feedback control, no local
- Nonlinear distribution is a h
- IPM: Lifting-based control

**Technical merit: Scalability + Model-free + Nonlinearity**

# Timeline

Year 1:

- Develop Scalable ML based optimization (IEM)
- Develop Scalable ML based nonlinear control (IPM)
- Extensive testing on IEEE prototype models

# Timeline

## Year 1:

- Develop Scalable ML based optimization
- Develop Scalable ML based nonlinear
- Extensive testing on IEEE prototype m

## Year 2:

- Integrate Data Center load models from parallel M.C Dean projects
- How does “erratic” data center demands change IEM and IPM?

# Timeline

## Year 1:

- Develop Scalable ML based optimization
- Develop Scalable ML based nonlinear
- Extensive testing on IEEE prototype m

## Year 2:

- Integrate Data Center load models from parallel M.C Dean projects
- How does “erratic” data center demands change IEM and IPM?

## Year 3:

- Further use of advanced ML for IEM (using weather data)
- Coordinated GFM control for data center BESS

# Project Team

## **PI: Dr. Aranya Chakraborty**

Professor

Assoc. Dept. Head for Research  
ECE and FREEDM

Power systems, control systems,  
Cyber-physical systems

## **Co-PI: Dr. Anderson de Queiroz**

Associate Professor

Civil Engineering

Power systems, optimization, operations  
research

## **PhD Fellow: Alex Haines**

ECE and FREEDM  
Control systems

## **PhD Fellow: Atia Tamsi**

ECE  
Power System Optimization

## **PhD Fellow: Owen Mank**

ECE and FREEDM  
Power Electronics
